

TMC DAY-3 TASK SUBMISSION

DAY: 3

DATE: 2026-07-06

INTERN NAME: Abdullah Bin Zubair

UNIVERSITY & YEAR: GIKI, Junior year

TEAM NAME: TMC Interns

AI TOOLS USED: Claude / Gemini

ANSWERS

1. Service line mix, 2022 → 2026:

AINow is clearly growing — from 4.2% of projects in 2022 to 41.7% in 2026, roughly a 10x jump in share. SAP ERP is clearly shrinking — from 41.7% in 2022 down to 16.7% in 2026, even though it's still the single biggest line by total project count over the whole period (36 of 120).

Training also shrank steadily, from 20.8% to 4.2%.

Cloud and Analytics stayed roughly flat across the years.

So yes — the data backs up TMC's "AI Transformation" story pretty clearly.

2. Highest average client satisfaction:

By service line, it's Training (4.63/5), with AI (AiNow) close behind (4.42/5); SAP ERP is lowest (3.66/5). By industry, it's Manufacturing (4.23/5); Banking is lowest (3.89/5).

3. Team size / budget vs. on-time delivery:

Yes, there's a real relationship, and team size matters more than budget. Team size has a moderate negative correlation with on-time delivery (-0.40); budget has a weaker one (-0.24). In plain terms: small teams of 1-3 people deliver on time 85% of the time, but that drops steadily as teams grow, down to just 31% on-time for teams of 10 or more. The data suggests bigger teams (and to a lesser extent bigger budgets) are associated with more delays — possibly because larger projects are inherently more complex, or because bigger teams are harder to coordinate.

Team size / budget vs. on-time delivery:
Yes, there's a real relationship, and team size matters more than budget. Team size has a moderate negative correlation with on-time delivery (-0.40); budget has a

weaker one (-0.24). In plain terms: small teams of 1-3 people deliver on time 85% of the time, but that drops steadily as teams grow, down to just 31% on-time for teams of 10 or more. The data suggests bigger teams (and to a lesser extent bigger budgets) are associated with more delays — possibly because larger projects are inherently more complex, or because bigger teams are harder to coordinate.

4. **An insight nobody asked for:** Late projects generate almost double the support tickets after go-live compared to on-time ones (6.61 vs 3.32 average). And SAP ERP is the extreme case here — it produces about 11.6 tickets per project on average, which is 5 to 20 times more than every other service line (Cloud, Analytics, AI, and Training are all under 2.2). So SAP ERP isn't just the slowest and lowest-satisfaction line — it's also creating a disproportionate ongoing support burden after launch, which is a cost that doesn't show up if you only look at on-time rate or satisfaction scores alone.

AI VERIFICATION (numerical)

AI calculation: AiNow is clearly growing — from 4.2% of projects in 2022 to 41.7% in 2026, roughly a 10x jump in share.

Manual calculation: Same as AI calculation

Data Insight Brief (for TMC leadership):

TMC's project mix is shifting hard toward AI, and the numbers back up the messaging. AI (AiNow) engagements grew from 4.2% of projects in 2022 to 41.7% in 2026, while SAP ERP's share fell from 41.7% to 16.7% over the same period — SAP ERP is still the largest line by volume, but its dominance is clearly eroding.

Client satisfaction is highest where projects are smaller and more contained: Training (4.63/5) and AI (AiNow) (4.42/5) lead, while SAP ERP trails at 3.66/5. By industry, Manufacturing clients are happiest (4.23/5); Banking clients are least satisfied (3.89/5).

Team size is the strongest predictor of delay in the whole dataset — more so than budget. Small teams (1-3 people) hit an 85% on-time rate; teams of 10+ fall to just 31%. And delays carry a hidden cost: late projects generate almost double the post-go-live support tickets of on-time ones, with SAP ERP alone averaging 11.6 tickets per project — 5 to 20x every other line.

Recommendation: As TMC continues scaling AiNow, apply the same lean-team discipline that makes AI and Analytics engagements succeed to SAP ERP delivery specifically, since that's where team-size-driven delays and post-go-live support costs are both concentrated.

PROMPT LOG

1. Load this dataset and show the service line mix by year as percentages — which line is growing, which is shrinking?
2. Which service line and which industry have the highest average client satisfaction?
3. Calculate the correlation between team size and on-time delivery, and between budget and on-time delivery — show the actual numbers, not just an impression.
4. Find one insight in this data that wasn't directly asked for — something about tickets, delays, or a pattern across service lines.

AI PLAYBOOK(SOLO)

GEMINI's RESPONSE:

1. The overall on-time delivery rate is 61.67% (74 out of 120 projects).
2. The correlation between Team Size and on-time delivery is -0.4042.
3. Training has the highest average Client Satisfaction at 4.63 (sum of 55.6 divided by 12 projects).

CLAUDE's RESPONSE:

1. Overall on-time delivery rate: 74 out of 120 projects = 61.7% (counted directly from the OnTimeDelivery column).
2. Correlation between TeamSize and on-time delivery (Yes=1/No=0): -0.40, a moderate negative relationship — larger teams are less likely to deliver on time.
3. Highest average ClientSatisfaction by service line: Training, at 4.63/5.

REFLECTION:

Most surprising thing I learned: According to the dataset , TMC should highly focus on SAP ERP's as they highly depend on it

One thing I'm still unsure about: Why the SAP ERP's share fell from 41.7% to 16.7% from 2022 to 2026

How my team helped: By numerical comparison between insights of different AI models used for the tasks

Time spent (approximately):1 hour
