AI-Powered Discovery Sprint

A 3-Day Engagement Program for New Interns

Research → Analyze → Build · powered by AI, delivered as a team

For: Summer 2026 Intern Cohort (CS & AI students, ~25)

Shape: Mix of solo + team work · one small deliverable every day

Tools: Free tiers of Claude, ChatGPT & Gemini only — no internal systems

Focus: How TMC is moving from Digital Transformation to **AI Transformation**

How your three days work

Welcome to TMC. You're joining a company whose whole direction right now is captured in one line on our homepage: *"From Digital Transformation to AI Transformation, we engineer what's next."* Over three days you'll discover what that means — using the same AI tools you already use as students, working shoulder-to-shoulder in small teams.

You don't need any company logins or paid tools — just free Claude, ChatGPT, or Gemini and a web browser. You're not being tested on memory. You're practising the real skill of this job: **use AI to understand something new fast, work with your team to pressure-test it, and turn it into something useful — while never trusting the AI blindly.**

Every day has the same three steps

1. **Research / Analyze** **SOLO** — you use AI + the web to explore the day's questions on your own.
2. **Discuss** **TEAM** — your team of ~5 compares findings, argues, fact-checks, and agrees on the truth.
3. **Build** **MIX** — together you produce one small artifact, then each of you submits it in the standard format (last page).

Two rules that matter most

- **AI is your teammate, not your oracle.** It sounds confident even when it's wrong — it invents facts and miscalculates numbers. Verify anything important against a real source or by hand.
- **Keep & submit your prompts.** How you ask an AI is a skill we grade as highly as the answer.

You work as a team

You'll be in **teams of ~5** (about 5 teams). You research alone so everyone thinks for themselves, then come together to combine and challenge each other's work — that mix is deliberate. Pick a team name; you'll put it on every submission.

Each day ≈ half a day (3–4 hrs). Scale the depth if you have more time.

Meet TMC — and the shift to AI

Goal: explain, in plain language, what TMC does across SAP, Cloud and AI — and what "AI Transformation" actually means for a business.

Phase 1 — Research SOLO ~85 min

Use AI + web to answer these. Push the AI: "is that accurate?", "give me a source", "explain like I'm a new grad".

1. **The basics (keep it light):** what is **enterprise software** and what is an **ERP**? In one line each, what is **SAP**, and what does a "system integrator / SAP partner" do?
2. **Who is TMC (TallyMarks Consulting)?** Founding year, home base, what they're known for, and one recent achievement.
3. **TMC's AI vertical:** find out what "**AiNow**" is (hint: TMC calls it a movement, not a product) and what TMC's **AI-powered analytics** does for clients.
4. **The big idea:** what does moving "*from Digital Transformation to AI Transformation*" mean? What's the difference between *digitizing* a process and making it *intelligent*?
5. **Why it matters:** give one example of a company task that becomes dramatically better when AI is added on top of ordinary business software.

Phase 2 — Discuss TEAM ~55 min

- Compare answers. Where did teammates' AI tools disagree? Which claims could you verify with a real source (start at tmc.ltd.com)?
- Agree on one shared set of answers — one source cited per answer.
- Build a team **glossary of 12 terms** you'd never used before today — mix business and AI (e.g. ERP, S/4HANA, cloud, AiNow, LLM, machine learning, data analytics, digital transformation, model, prompt).

Phase 3 — Build MIX ~40 min

Daily Deliverable D1:

1. **"Explain to a friend" paragraph (solo):** in 130–170 words, explain what TMC does — covering *both* its SAP/ERP roots *and* its AI direction — as if texting a university friend. No jargon without a plain-English gloss.
2. **Team glossary (team):** your 12 terms, each with a one-line definition in your own words.

The SDLC — and how AI is rewriting it

Goal: understand how software actually gets built (the SDLC), how AI is changing every stage of it, and where the field is heading.

A quick flavour before you research: what is the SDLC?

The **Software Development Life Cycle (SDLC)** is the repeatable set of stages teams follow to build software — the same way construction follows plan → build → inspect. Classic stages:

Traditionally each stage was slow and heavily manual. AI is now compressing all of them — and that shift is exactly what this day is about.

Phase 1 — Research SOLO ~85 min

1. Explain each SDLC stage in one plain sentence. In one line each, what's the difference between **Waterfall** and **Agile**?
2. For *each* stage, how is **AI changing it today**? (e.g. AI drafting requirements, **coding assistants** like Copilot/ Claude, AI-generated tests, automated code review, AI monitoring/"AIOps".) Give a concrete example per stage.
3. What are the **risks and limits** of leaning on AI to build software? (hallucinated or insecure code, over-trust, needing a human to verify.)
4. **Where are we heading?** Research "agentic AI" / "AI agents" and the idea of "**AI-first**" development. How does this connect to TMC's *AiNow* message that AI should be woven into *every* layer, not bolted on?

Phase 2 — Discuss TEAM ~55 min

- Together build an "**SDLC × AI**" table: one row per stage → the traditional way → the AI-augmented way → one risk to watch.
- Debate as a team: "*If AI can write code, what is a software engineer's job in 5 years?*" Capture your best two arguments on each side.
- Fact-check one claim your AI made about a tool or capability against a real source — AI often overstates what tools can do.

Phase 3 — Build MIX ~45 min

Daily Deliverable D2:

1. **SDLC × AI table (team)**: the 6-stage table above, in your own words.
2. **"Where software is heading" take (solo)**: a 120–150 word point of view answering the 5-year question, grounded in what you found, with one cited source.

Turn data into insight with AI

Goal: use AI to analyse a real-shaped dataset, work as a team to build a "data story," and critically compare how the AI tools handle numbers.

Your dataset: TMC_Projects_Sample.csv (provided with this pack)

A fictional set of **120 TMC delivery projects (2022–2026)**. Each row is one project with these columns:

Column	Meaning	Column	Meaning
ProjectID	unique code	DurationMonths	length of project
Client / Industry	who & sector	TeamSize	consultants assigned
Region	PK, UAE, KSA, Qatar, USA	BudgetUSD	project budget
ServiceLine	SAP ERP · Cloud · AI (AiNow) · Analytics · Training	OnTimeDelivery	Yes / No
Year	2022–2026	ClientSatisfaction	score 1–5
PostGoLiveTickets		issues raised after launch	

How to use it: upload the CSV directly into Claude/Gemini (or paste it into ChatGPT), and ask the AI to help you explore it. You can also ask the AI to make a chart or table.

Phase 1 — Analyze SOLO ~80 min

Use a free AI tool to dig into the data and answer:

1. How has the **mix of service lines changed from 2022 to 2026**? Which one is clearly growing, which is shrinking? (This is TMC's story — see if the data shows it.)
2. Which **service line and which industry** have the highest average **client satisfaction**?
3. Is there a relationship between **team size (or budget) and on-time delivery**? What does the data suggest?
4. Find **one insight of your own** that nobody asked for.

Verify the AI's numbers — this is the point

AI tools frequently miscount and miscalculate. Pick **at least one number** the AI gives you (an average, a count, a percentage) and check it yourself — by hand, in a spreadsheet, or by asking a second tool. Note in your submission whether it matched.

Phase 2 — Discuss TEAM ~50 min

- Pool everyone's findings and agree on your team's **top 3 insights** — keep only what you could verify.
- Turn them into a **"data story"**: what's happening, why it might be happening, and **one recommendation** for TMC leadership.
- Have the AI generate **one chart or clean table** that best supports your story.

Phase 3 — Build MIX ~50 min

Daily Deliverable D3:

1. **Data Insight Brief (team):** one page — your 3 verified insights + one recommendation + one supporting chart/table, written for a non-technical leader.
2. **AI Playbook (solo):** run one identical analysis question in **Claude, ChatGPT and Gemini**. In ~130 words: which got the numbers right, did any invent a statistic, and what's your single best prompt tip?

Optional stretch (for teams that finish early)

Turn your data story into a **5-slide outline** and have one teammate present it in 3 minutes.

How to submit your work

At the end of each day, every intern submits one block in **exactly this format** (plain text). Keep the field labels unchanged.

```
=== TMC INTERN SUBMISSION ===
DAY: [1 / 2 / 3]
DATE: [YYYY-MM-DD]
INTERN NAME: [Your full name]
UNIVERSITY & YEAR: [e.g. FAST-NUCES, Sophomore]
TEAM NAME: [Your team]
AI TOOLS USED: [Claude / ChatGPT / Gemini / other]

--- ANSWERS ---
[Your answers to the day's questions, numbered.]

--- DELIVERABLE ---
[The day's artifact: paragraph / glossary / SDLC table /
data insight brief, as applicable.]

--- PROMPT LOG ---
[2-4 of the actual prompts you used, best first.]

--- SOURCES & VERIFICATION ---
[Links you verified facts against. For Day 3, note which
number you checked and whether the AI got it right.
Mark anything unverified as "AI - unverified".]

--- REFLECTION ---
Most surprising thing I learned:
One thing I'm still unsure about:
How my team helped:
Time spent (approx):
=== END ===
```

How your work is evaluated

Criterion	Weight	What "strong" looks like
Accuracy	25%	Claims and numbers are correct and match real sources.
Verification	20%	Facts/numbers are checked; unverified AI output is honestly flagged, not passed off as fact.
Clarity	20%	A non-technical reader would understand it; jargon is explained.
AI & prompt craft	20%	Thoughtful prompts — roles, follow-ups, "cite your source", comparing tools, iterating.
Insight & teamwork	15%	Genuine observations, caught a hallucination, and clear contribution to the team's result.

Starter Kit & Resources

Trusted starting points (verify AI answers against these)

- **TMC:** tmcltd.com and services.tmcltd.com — company, AiNow, services, awards, industries.
- **SAP:** sap.com — for the light SAP/ERP background on Day 1.
- General explainers (Wikipedia, reputable tech blogs) are fine for concepts like SDLC, agentic AI, and machine learning — but confirm any TMC-specific fact on the official sites above.

Prompt-engineering starter kit

- **Give a role:** "You are a patient teacher explaining to a CS sophomore..."
- **Ask for sources:** "...and cite where each fact comes from. If you're not sure, say so."
- **Force plain English:** "No jargon; define any acronym the first time."
- **For data:** "Show your working and the exact numbers you used, so I can check them."
- **Iterate & stress-test:** "Too technical — redo for a non-technical leader," then "What might be wrong or outdated here?"

Working well as a team

- Do the solo research *first* — arrive with your own answer so the discussion has something to chew on.
- When AIs disagree, don't just pick one — figure out *which* is right and *how you know*.
- Split the build: one person drafts, others fact-check and tighten. Everyone should be able to explain the final result.

What you'll walk away with

By the end you'll be able to explain what TMC does across SAP, Cloud and AI; describe how modern software gets built and how AI is transforming it; and you'll have turned raw data into a real insight — all while getting sharper at using AI tools critically and working as a team. That combination is exactly what the work here demands.

TMC (TallyMarks Consulting) — internal onboarding material, Summer 2026. Company facts should be verified at tmcltd.com. The dataset and any client names in it are fictional, created for training only.
